Overview

Reliable, up-to-date estimates of the proportion of a general population affected by different diseases or health conditions is a key ingredient of effective health policy, planning and evaluation. This booklet provides latest available estimates of the prevalence of depression and other common mental disorders at the global and regional level, together with data concerning the consequences of these disorders in terms of lost health.

Globally, the total number of people with depression was estimated to exceed 300 million in 2015. Nearly that number again suffers from a

range of anxiety disorders. Since many people experience both conditions simultaneously (comorbidity), it is inappropriate to simply add these two figures together to arrive at a total for common mental disorders.

The consequences of these disorders in terms of lost health are huge. Depression is ranked by WHO as the single largest contributor to global disability (7.5% of all years lived with disability in 2015); anxiety disorders are ranked 6th (3.4%). Depression is also the major contributor to suicide deaths, which number close to 800 000 per year.

Frequently asked questions

1. What are common mental disorders? What is depression?

Common mental disorders refer to two main diagnostic categories: depressive disorders and anxiety disorders. These disorders are highly prevalent in the population (hence why they are considered 'common'), and impact on the mood or feelings of affected persons; symptoms range in terms of their severity (from mild to severe) and duration (from months to years). These disorders are diagnosable health conditions, and are distinct from feelings of sadness, stress or fear that anyone can experience from time to time in their lives.

2. How many people are affected by depression?

At a global level, over 300 million people are estimated to suffer from depression, equivalent to 4.4% of the world's population.

3. Is the number of people with common mental disorders increasing?

The number of persons with common mental disorders globally is going up, particularly in lower-income countries, because the population is growing and more people are living to the age when depression and anxiety most commonly occurs.

4. Who is most likely to get depressed?

Although depression can and does affect people of all ages, from all walks of life, the risk of becoming depressed is increased by poverty, unemployment, life events such as the death of a loved one or a relationship break-up, physical illness and problems caused by alcohol and drug use.

Introduction

Reliable, up-to-date estimates of the proportion of a general population affected by different diseases or health conditions is a critical ingredient of effective health policy, planning and evaluation. Epidemiological studies of the prevalence and incidence of a range of psychiatric disorders have now been undertaken in a wide range of low-, middle- and high-income countries, which have contributed greatly to a better understanding of how common these disorders are across the world. Advances in measuring the fatal and non-fatal consequences of these diseases – including quantification of time spent in a state of ill-health – has also enabled a more systematic comparison of the relative contribution that different diseases and their underlying risk factors make to the overall toll of death and disability.

This booklet provides latest available estimates of the prevalence of depression and other common mental disorders at the global and regional level, together with data concerning the consequences of these disorders in terms of lost health. Country-specific estimates are also provided (see [Appendix](#)). It offers complementary information to that provided in other information products developed by WHO and others on the appropriate public health response to these disorders, including their treatment and prevention (<http://www.who.int/topics/depression>; http://www.who.int/mental_health/mhgap).

Common mental disorders refer to two main diagnostic categories: depressive disorders and anxiety disorders; a definition of these disorders is provided in the [Box](#) on page 7.

Data sources

Syntheses of the available epidemiological literature on the prevalence of depression and other common mental disorders have been undertaken as part of earlier iterations of the Global Burden of Disease (GBD) study, including reviews published for the 2000 and 2010 editions [1-4]. The latest set of Global Health Estimates made available by WHO is for 2015 (http://www.who.int/healthinfo/global_burden_disease/estimates), which includes regional and also country-specific estimates of deaths, years of life lost and years lived with disability by cause.

In order to provide the most up-to-date information on the number of people with common mental disorders, WHO has worked with the lead GBD researchers for mental and behavioural disorders (based at the School of Public Health, University of Queensland, Australia) to produce – and present here – estimates by WHO Region for the year 2015. Country-specific estimates of disease prevalence for the year 2015, which are shown in the Appendix, can also be accessed via a GBD Results Tool made available by the Institute of Health Metrics and Evaluation (Seattle, USA) at: <http://ghdx.healthdata.org/gbd-results-tool>.

Definitions

Depressive disorders are characterized by sadness, loss of interest or pleasure, feelings of guilt or low self-worth, disturbed sleep or appetite, feelings of tiredness, and poor concentration. Depression can be long-lasting or recurrent, substantially impairing an individual's ability to function at work or school or cope with daily life. At its most severe, depression can lead to suicide. Depressive disorders include two main sub-categories:

- **major depressive disorder / depressive episode**, which involves symptoms such as depressed mood, loss of interest and enjoyment, and decreased energy; depending on the number and severity of symptoms, a depressive episode can be categorized as mild, moderate, or severe; and
- **dysthymia**, a persistent or chronic form of mild depression; the symptoms of dysthymia are similar to depressive episode, but tend to be less intense and last longer.

A further important distinction concerns depression in people with or without a history of manic episodes. Bipolar affective disorder typically consists of both manic and depressive episodes separated by periods of normal mood. Manic episodes involve elevated mood and increased energy, resulting in over-activity, pressure of speech and decreased need for sleep. Bipolar affective disorder is not included in the data below.

Anxiety disorders refer to a group of mental disorders characterized by feelings of anxiety and fear, including **generalised anxiety disorder (GAD)**, **panic disorder**, **phobias**, **social anxiety disorder**, **obsessive-compulsive disorder (OCD)** and **post-traumatic stress disorder (PTSD)**. As with depression, symptoms can range from mild to severe. The duration of symptoms typically experienced by people with anxiety disorders makes it more a chronic than episodic disorder.

Global and regional estimates of prevalence

Depression

- The proportion of the global population with depression in 2015 is estimated to be 4.4%. Upper and lower uncertainty intervals are represented in the bar graph by the error bars. Depression is more common among females (5.1%) than males (3.6%).
- Prevalence varies by WHO Region, from a low of 2.6% among males in the Western Pacific Region to 5.9% among females in the African Region. Country-specific estimates can be accessed at <http://ghdx.healthdata.org/gbd-results-tool>.
- Prevalence rates vary by age, peaking in older adulthood (above 7.5% among females aged 55-74 years, and above 5.5% among males). Depression also occurs in children and adolescents below the age of 15 years, but at a lower level than older age groups.
- The total number of people living with depression in the world is 322 million. Nearly half of these people live in the South-East Asia Region and Western Pacific Region, reflecting the relatively larger populations of those two Regions (which include India and China, for example).
- The total estimated number of people living with depression increased by 18.4% between 2005 and 2015 [5]; this reflects the overall growth of the global population, as well as a proportionate increase in the age groups at which depression is more prevalent.

Cases of depressive disorder (millions), by WHO Region

Prevalence of depressive disorders (% of population), by WHO Region

Global prevalence of depressive disorders, by age and sex (%)

Source: Global Burden of Disease Study 2015 (<http://ghdx.healthdata.org/gbd-results-tool>)
Regional data shown are age-standardized estimates.

Global and regional estimates of prevalence

Anxiety disorders

- The proportion of the global population with anxiety disorders in 2015 is estimated to be 3.6%. As with depression, anxiety disorders are more common among females than males (4.6% compared to 2.6% at the global level).
- In the Region of the Americas, as many as 7.7% of the female population are estimated to suffer from anxiety disorder (males, 3.6%). Country-specific estimates can be found at <http://ghdx.healthdata.org/gbd-results-tool>.
- Prevalence rates do not vary substantially between age groups, although there is an observable trend towards lower prevalence among older age groups.
- The total estimated number of people living with anxiety disorders in the world is 264 million. This total for 2015 reflects a 14.9% increase since 2005 [5], as a result of population growth and ageing.

Cases of anxiety disorder (millions), by WHO Region

Prevalence of anxiety disorders (% of population), by WHO Region

Regional data shown are age-standardized estimates.

Global and regional estimates of prevalence

Common mental disorders

- Common mental disorders refer to a range of anxiety and depressive disorders. A summary of the global and WHO Regional prevalence of these disorders is shown below. Globally, it is estimated that 4.4% of the global population suffer from depressive disorder, and 3.6% from anxiety disorder. There is modest variation around this global rate of prevalence in WHO Regions: for depression, rates vary from 3.6% in the Western Pacific Region to 5.4% in the African Region; for anxiety disorders, rates vary from 2.9% in the Western Pacific Region to 5.8% in the Region of the Americas.
- Since many people experience both conditions simultaneously (comorbidity), it is inappropriate to simply add these two figures together to arrive at a total for common mental disorders.
- Within these overall estimates of prevalence, there is a range of severity, with at least one-third of symptomatic cases following a moderate-severe course [4].

Prevalence of common mental disorders (% of population by WHO Region)

Source: Global Burden of Disease Study 2015 (<http://ghdx.healthdata.org/gbd-results-tool>)
Regional data shown are age-standardized estimates.

Global and regional estimates of health loss

Common mental disorders lead to considerable losses in health and functioning. These losses can be quantified at the population level by multiplying the prevalence of these disorders by the average level of disability associated with them, to give estimates of Years Lived with Disability (YLD). Global and WHO Regional YLD results from WHO's Global Health Estimates for the year 2015 are shown below. Country-specific estimates are provided in the Appendix and are also available at http://www.who.int/healthinfo/global_burden_disease/en

YLDs are added to Years of Life Lost (YLL) to compute Disability-Adjusted Life Years (DALYs), which are the key metric used to assess the Global Burden of Disease (GBD). In the case of depression and anxiety disorders, no YLL are attributed directly to these disorders in the GBD analyses, thus estimates of YLD also represent the total estimated DALYs for these conditions. Depression, however, is a major contributor to suicide (categorised in GBD analyses as intentional injuries); global and regional data on suicide is given below.

Depressive disorders

Depressive disorders led to a global total of over 50 million Years Lived with Disability (YLD) in 2015. More than 80% of this non-fatal disease burden occurred in low- and middle-income countries. Rates vary across WHO Regions, from 640 YLD per 100 000 population in the Western

Pacific Region to over 850 in low- and middle-income countries of the European Region. Globally, depressive disorders are ranked as the single largest contributor to non-fatal health loss (7.5% of all YLD).

Depressive disorders	Total YLD (thousands)	YLD per 100,000	% of all YLDs	Rank cause
Low- and middle-income countries				
- African Region	7 229	731	7.9	2
- Eastern Mediterranean Region	4 049	685	6.9	2
- European Region	3 517	859	8.1	2
- Region of the Americas	5 106	844	9.3	1
- South-East Asia Region	13 967	724	7.0	2
- Western Pacific Region	10 525	640	7.2	2
High-income countries	9 608	839	7.9	2
World	54 215	738	7.5	1

Source: WHO Global Health Estimates (http://www.who.int/healthinfo/global_burden_disease)

Global and regional estimates of health loss

Anxiety disorders

Anxiety disorders led to a global total of 24.6 million YLD in 2015. Again, rates vary across WHO Regions, from 267 YLD per 100 000 population in the African Region to over 500 in the Region of the Americas. Estimates are lower for anxiety disorders compared to depression

because these disorders are associated with a lower average level of disability. Anxiety disorders are ranked as the sixth largest contributor to non-fatal health loss globally and appear in the top 10 causes of YLD in all WHO Regions.

Anxiety disorders	Total YLD (thousands)	YLD per 100,000	% of all YLDs	Rank cause
Low- and middle-income countries				
- African Region	2 639	267	2.9	7
- Eastern Mediterranean Region	2 093	354	3.6	7
- European Region	1 239	302	2.9	8
- Region of the Americas	3 433	567	6.2	3
- South-East Asia Region	5 522	286	2.8	9
- Western Pacific Region	4 506	274	3.1	8
High-income countries	5 061	442	4.2	4
World	24 621	335	3.4	6

Source: WHO Global Health Estimates (http://www.who.int/healthinfo/global_burden_disease)

Suicide

- WHO Global Health Estimates provide a comprehensive assessment of mortality due to diseases and injuries for all regions of the world. In the year 2015, it is estimated that 788 000 people died due to suicide; many more than this number attempted (but did not die by) suicide. Suicide accounted for close to 1.5% of all deaths worldwide, bringing it into the top 20 leading causes of death in 2015. Suicide occurs throughout the lifespan and was the second leading cause of death among 15-29 year olds globally in 2015.
- The suicide rate varies by WHO Region and by sex, ranging from below 5 per 100 000 population among females in low- and middle-income countries of the Eastern Mediterranean and American Regions, to 20 or more among males in high-income countries and also in the low- and middle-income countries of the African, European and South-East Asian Regions. 78% of global suicides occurred in low- and middle-income countries in 2015.
- More data at http://www.who.int/mental_health/prevention/suicide/suicideprevent/en

Depression and Other Common Mental Disorders Global Health Estimates

Reliable, up-to-date estimates of the proportion of a general population affected by different diseases or health conditions is a key ingredient of effective health policy, planning and evaluation. This booklet provides latest available estimates of the prevalence of depression and other common mental disorders at the global and regional level, together with data concerning the consequences of these disorders in terms of lost health.
